

Possible Solutions

- a) Mr. Chirinos likes to put his class of 24 students in groups for certain activities. If he has 6 baskets of materials for the groups to share equally, how many students can he put in each group?

24 students divided by 6 baskets equals 4 students per basket, or 4 students per group.

- b) Mr. Chirinos likes to put his class of 24 students in groups for certain activities. If he wants 3 students to be in each group, how many groups will he make?

24 students divided by 3 in each group, makes 8 groups.
