

Possible Solution

Ben has a summer job working for a painter. One of his assignments is to transfer leftover paint from large 5-gallon buckets to smaller 1-gallon cans to keep the paint fresh. The painter had parts of several large buckets of red paint left from a bunch of different jobs. Determine to the nearest gallon how much paint was left.

Ben filled 3 cans and less than half of a fourth can, therefore to the nearest gallon there were 3 gallons of paint left over.
