## Possible Solutions

a) Circle all of the rectangles that are partitioned into fourths, and cross out any rectangle that is not partitioned into fourths and explain why it is not.

## Possible Explanation

A whole partioned into fourths will have 4 equal parts. The third rectangle is divided into 5 parts, so it cannot be partitioned into fourths. The rest of the rectangles are partitioned into 4 equal parts or fourths.
b) Circle the shapes that have been divided in halves with one-half shaded. Look at the ones you did not circle and explain why you did not circle them.

## Possible Explanation

A whole partitioned into halves will have 2 equal parts. The second rectangle has been divided into 2 parts but they are not equal. So the parts are not halves. The last rectangle has been divided into 3 parts, so the parts are not halves.
