

Possible Solutions

Look at the following shapes. Which shapes have one-half shaded?

Look at the shapes you did not identify as one-half shaded. Explain why they do not have one-half shaded.

A whole partitioned into halves will have 2 equal parts. The second rectangle has been divided into 2 parts but they are not equal. So the shaded part is not a half. The last rectangle has been divided into 3 parts, so the parts are not halves.
